software that can be used to detect fake flash drives and has been designed with three main features:

- Identifying fake flash drives by testing the formatting process to its standard capacity.
- Allowing you to use a fill test to avoid formatting the drive.
- Testing the drive for a missing memory part to verify the authenticity.

This can be done by using the fill test that is designed for it. The reason for this is that all fake flash drives will reformat during the testing process and as a result, there will be a

able to detect fake flash drives quickly. Feb 20, 2015 Flash drives are tools that allow users to easily transfer data, save any type of files, and store it on a non-volatile memory device. These flash drives are much smaller than floppy disks and contain non-volatile memory. Generally, these are used by computer users to store their files and back up their data in the event of a hard drive crash or a full memory takeover by another system. The memory inside the flash drive is electrically erasable (which means that it can be erased over and over again) and it can hold a lot of data. The increasing popularity of flash drives has lead
