Most people who are just starting out with Photoshop are familiar with brushes. While the brushes in Photoshop are very powerful, they can also be quite confusing, especially if you don't know the basic functionality of brushes. It is essential to understand the basic features of brushes, and try and master basic brush properties before moving on to complex brushes. The following types of brushes are currently available in Photoshop: Brushes *Brush presets *Magnetic Stylus *Rotating brushes *Arrow tool *Bitmap masks *Pen tool *Layers *Effects To understand the basic brush properties, think of Photoshop's brushes as a four-segmented compass where each segment represents an action the brush can perform. The four segments are: *W : draws a line *S : erases pixels *D : erases pixels and fills the area behind the brush *A : can be used to add pixels to the area behind the brush or fill it with pixels If you paint with W and without S, for example, and then select the brush's history, the action that this brush performed is W. If the W action is performed on a duplicate layer of the image you can select it and then perform additional actions, such as fill, copy, paste, etc. The cursor becomes a crosshatch. If you paint with S and without W, the history will be WS and if you paint with W and S, the history will be WSW. This brush will function the same way. *Magnetic Stylus: With Magnetic Stylus you can paint with a cursor in a selection, or make a brush that follows the edges of your selection. *Rotating brushes: Rotating brushes are similar to the Magnetic Stylus. You can rotate, scale, and mirror the size of your brush. Also, this brush can follow the edges of a selection or follow an image (in a similar way to Magnetic Stylus). *Arrow tool: This tool allows you to paint with the cursor. You can also use the arrow tool to rotate, scale, or mirror the size of the brush. *Bitmap masks: This brush is useful when you need to apply the same effects to multiple areas of an image but the edges

Structure and regulation of human factor XII, an important player in the coagulation cascade. The intrinsic coagulation pathway is initiated by activation of plasma zymogens by contact with cell-surface receptors, exposure to injury, or by binding of protease complexes. When the contact system is activated, factor XII is autoactivated by limited proteolysis. In contrast to other protein zymogens of the intrinsic pathway, human factor XII is a single-chain polypeptide and displays more than 95% sequence homology to factor XII from other species. These similarities enable the production of mouse and rat monoclonal antibodies that recognize human factor XII. Most of these antibodies react with the same epitope, one of the three cysteine residues in the activation loop of factor XII. The murine antibody 1P10, of IgG1 subtype, was used to immunoprecipitate factor XII from human plasma, to study its distribution, and to map the amino acids in its primary structure that are critical for catalysis. Its binding site involves residues 82, 222, and 353. The results indicated that factor XII is a highly glycosylated zymogen and, upon activation, is converted to a two-chain form with a similar N-terminal domain and a disulfide-linked heavy and light chain. Structural features that are common to other serine proteases include a primary sequence of 20 amino acids with a catalytic triad consisting of His57, Cys45, and Ser52. Like factor VII, factor XII circulates as an inactive zymogen and in the presence of tissue factor, forms a complex with factor VIIa. The relevance of factor XII activation in the occurrence of disseminated intravascular coagulation or thrombophlebitis was assessed in a series of patients with severe infections, transplantation, or inflammatory conditions.Bohol: Torched orangutan rescued Bohol: The head of Biodiversity Management and Research Office, Biodiversity Management Center, Prof. Carl A.
